For photographers, Photoshop is a prime tool for helping us further enhance the quality of our images, such as creating realistic, detailed, or more abstract images. Photoshop is one of the most commonly used software applications in the world, second only to Microsoft Word. Photoshop has proven

itself time and again to be a critical tool in the world of digital imaging.

Photo via Adobe. Without further ado, here are the best Mac apps for graphic designers and Photoshop enthusiasts. 1. Pixelmator Pro Pixelmator is a macOS app for photographers and graphic designers who often need to edit photos or graphics to create original works. Pixelmator Pro, the professional version of Pixelmator, is designed to help you create beautiful art and

graphics. It is highly recommended to buy a license if you need the best photo editing software for macOS. Adobe Creative Cloud Pricing: \$49.99 per month Customer Support: 24/7 Website: Pixelmator.com Key features: Templates: 8 free Adobe-compliant templates included Application shortcuts: Free to use and available throughout the app Device support: iPhone, iPad, and Mac The best: Highly proficient and easy to use 2. Adobe Photoshop Adobe Photoshop is a professional picture editing software, known

for its flexibility and versatility. It is one of the most widely used and popular applications on a desktop computer. It is only available for the Windows platform. As such, users need a Windows computer and a Windows install disc to use Photoshop. It is not ideal if you are not comfortable with Windows computers. Pricing: Free Customer Support: 24/7 Website: [Adobe.com/photoshop](https://www.adobe.com/photoshop) Key features: Image recognition: Easily identify all types of images without any extra hassle File formats: Supports JPG, PNG, TIFF, GIF,

An airbrush tool is a way to create brush effects on a layer. It lets you paint in a brush like way in Photoshop. Brushes come in different colors and styles. Each style has its own set of features or abilities. Styles include watercolor, grunge, and manga. Effect tools can be used in a similar way as brushes, except you apply the effects with a tool instead of a brush. An Iris or Gradient tool is a brush or effect tool that allows you to blend colors, or to create (or break) a gradient.

The Burn tool allows you to remove or brighten an image's lighting. The Dodge and Burn tool allows you to selectively or nondiscriminately lighten or darken certain areas of an image. The Dodge tool allows you to remove a certain amount of an image's shadows without significantly changing the image's brightness. The Burn tool allows you to remove a certain amount of an image's highlights without significantly changing the image's brightness. Photoshop has 15 effect tools, including color adjustment, vignette, cross-

process, levels, contrast, and exposure. The Shadow and Tone tools allow you to adjust the colors, light, and darkness in an image. There are five text-related effects: Marquee, Magic Rectangle, Rectangle Select, Text, and Type. The Marquee tool allows you to draw a box around an image and cut that portion out. The Magic Rectangle tool allows you to draw a box around a specific part of an image to crop that area. Rectangle Select allows you to select an area of an image and crop a new layer from that selection. The Text

tool allows you to draw text on a layer and change fonts, sizes, and colors. Photoshop has eight color adjustment tools: Levels, Hue/Saturation, Curves, Colorize, White Balance, Black and White, Brightness/Contrast, and Grayscale. Levels allows you to lighten or darken an image by adjusting the brightness of the shades or the shadows. Hue/Saturation controls the color of an image while retaining the brightness of the shades and shadows. Curves is a way to shift the colors in an image, without changing the brightness. The

tool allows you to shift the image along a preset curve to obtain a specific color. White Balance is a tool that allows you to apply a warmer or cooler color to an image. You can also control

Dynamics of Co(II) and Cu(II) binding to poly-N-methylsulfonethylethanolamine phosphate. Using spectrophotometric, calorimetric, and magnetic techniques, the thermodynamics of binding of equimolar Cu(II) and Co(II) to the poly-N-methylsulfon-

ethylethanolamine phosphate (MeSNPEA phosphate) have been investigated. Both the binding of metal ions to the phosphate group and the accompanying proton release are exothermic in the pH range 3-10. The binding process is accompanied by a change in the equilibrium constant of about 10^4 times for Cu(II) and about 10^7 times for Co(II). The binding to MeSNPEA phosphate is a highly cooperative phenomenon and the change in the binding constant is associated with a shift in the $pK(a)$ of the phosphate group to

a more acidic position. The stoichiometry of the binding of metal ions to MeSNPEA phosphate is close to 1. The binding and metallation of the phosphate group involves the positive charge being transferred from the phosphate group to metal ions. The thermodynamic data suggest that the proton release occurs in two steps. The proton released first from the most acidic groups and then from the non-protonated groups. The thermodynamics of binding of Cu(II) and Co(II) to MeSNPEA phosphate indicate that the

metal binding to the phosphate groups over the range pH 3-10 proceeds via three steps: adsorption, redistribution of binding, and final metallation. Detection of biliary tract cancer by intraoperative image cytometry. The present study was undertaken to determine the feasibility of detecting biliary tract cancer by intraoperative image cytometry (IIC). In 31 samples of cancerous lesions (8 ampullary cancers, 7 extrahepatic bile duct cancers, 4 gallbladder cancers, 6 common bile duct cancers, and 5 intraductal

neoplasm of the papilla of Vater), we made an analysis for as many as 42 parameters of which 14 were considered significant in determining cancer. By an analysis for 16 to 30 minutes on the basis of clinical information and biopsy, benign and malignant lesions were distinguishable from one another in some cases (14/25). The results of IIC paralleled those of surgical histology in 14 patients, i.e., cancers were detected
